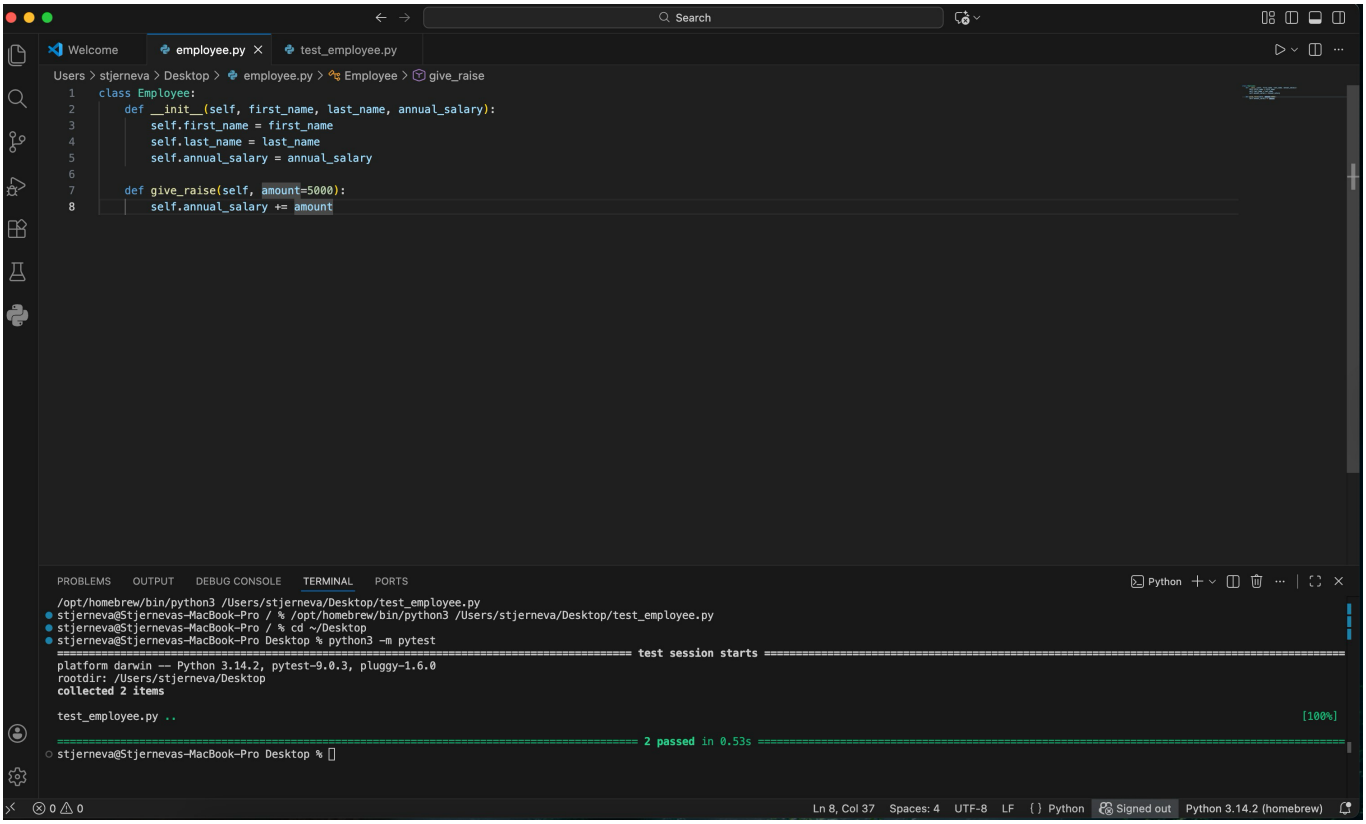
11-3 Employee

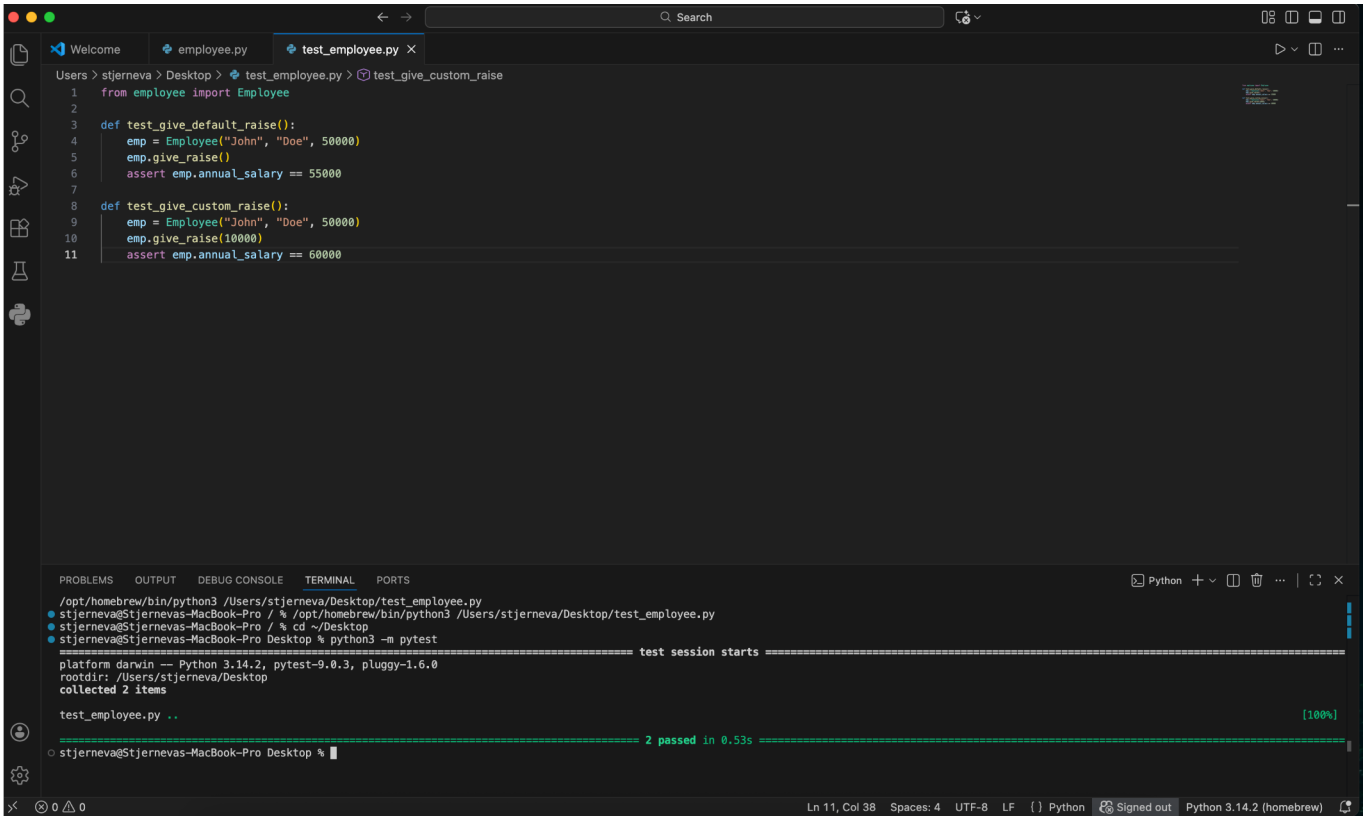
Screenshot 1 – Employee Class (employee.py)

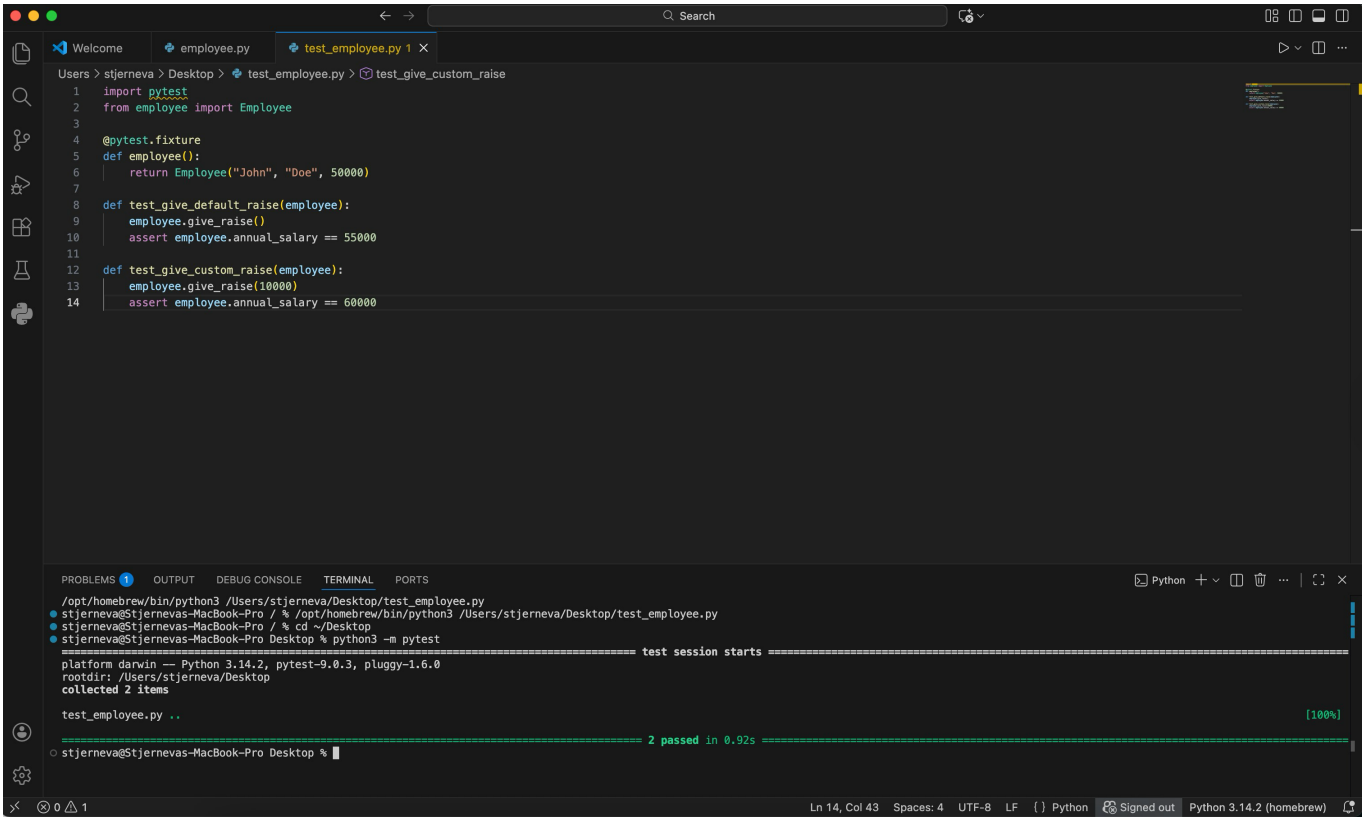
This file contains the Employee class with the __init__() method to store the employee's first name, last name, and annual salary. It also includes the give_raise() method, which adds a default raise of $5,000 or a custom raise amount.



Screenshot 2 – Testing Without Fixture (test_employee.py)

This test file shows two test functions: test_give_default_raise() and test_give_custom_raise(). Each test creates a new employee instance and verifies that the salary increases correctly.



Screenshot 3 – Testing With Fixture (test_employee.py + Output)


This version uses a pytest fixture to create the employee object once and reuse it in both test functions. The test output confirms that both tests passed successfully.
