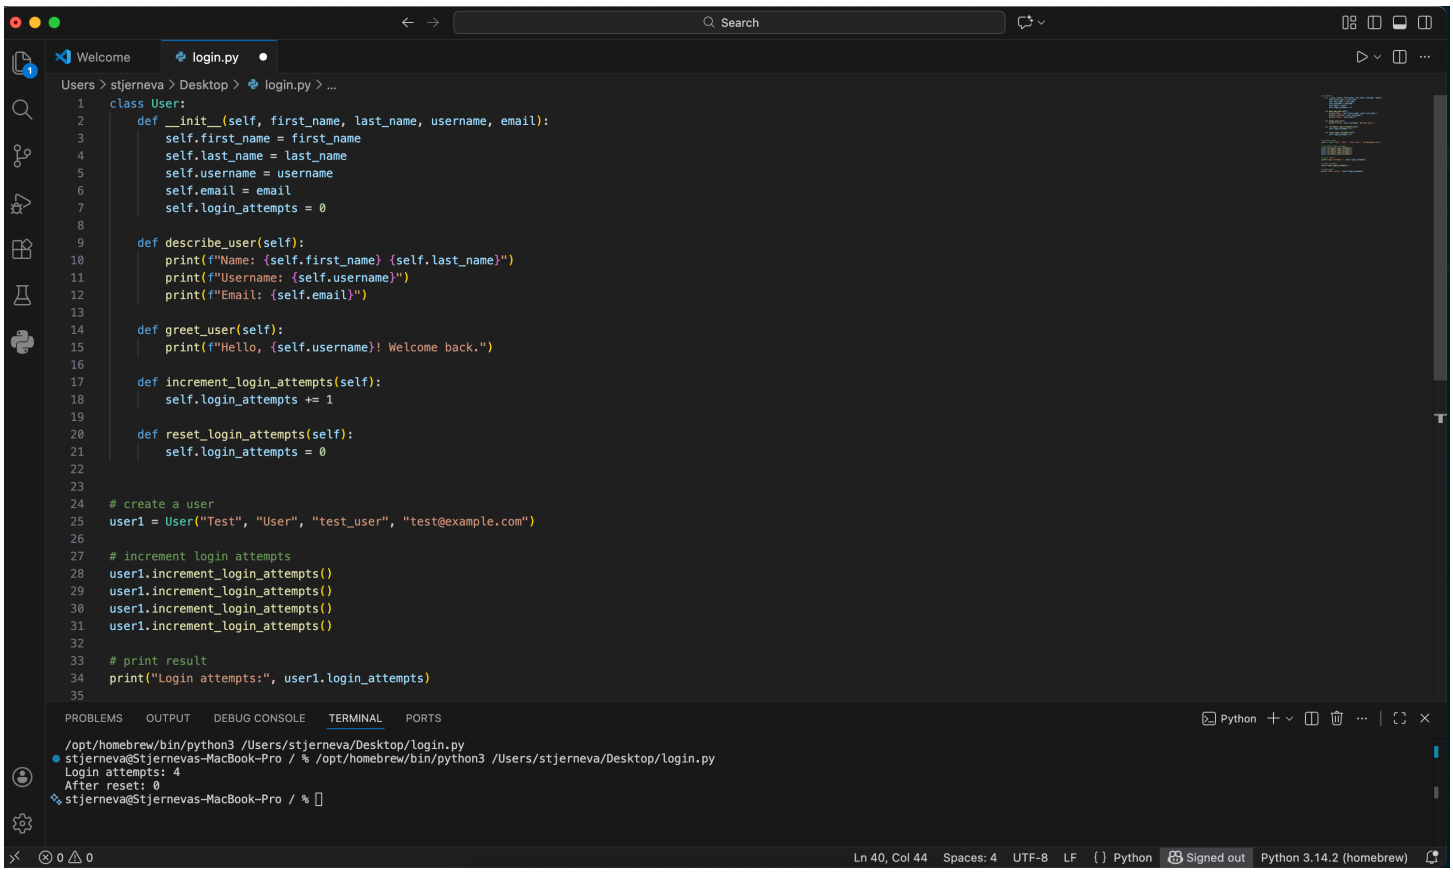
CSC 121 – Python Programming

31 March 2026

9-5. Logins

For this assignment, I initially considered using my personal information to make the code more realistic and meaningful. However, since the project will be uploaded to GitHub and may be publicly accessible, I chose to use a template-style format with placeholder information instead, in order to protect my personal data.

I hope this approach is acceptable, as it maintains the intended functionality of the assignment while ensuring privacy and security.



Two screenshots are included. The second screenshot can be seen below.

Welcome | login.py

Users > stjerneva > Desktop > login.py > ...

```python
class User:
        self.login_attempts += 1

    def reset_login_attempts(self):
        self.login_attempts = 0

# create a user
user1 = User("Test", "User", "test_user", "test@example.com")

# increment login attempts
user1.increment_login_attempts()
user1.increment_login_attempts()
user1.increment_login_attempts()
user1.increment_login_attempts()

# print result
print("Login attempts:", user1.login_attempts)

# reset attempts
user1.reset_login_attempts()

# print again
print("After reset:", user1.login_attempts)
```
